Scienze del Territorio is the online journal of the **Territorialist Society**.

The journal hosts pioneering studies pointed at enhancing **territorial heritage**, bringing back together the diverse meanings of **places**, frequently divided by confined institutional sciences and practices, and proposing transformation projects based on these guidelines.

As an identity code of its scientific method and action, the journal promotes forms of meeting and mediation among **theoretical** thought, **technical** and local knowledge.

Scienze del Territorio is the official journal of the Territorialist Society. The journal hosts pioneering studies pointed at enhancing territorial heritage, bringing back together the diverse meanings of places, frequently divided by confined institutional sciences and practices, and proposing transformation projects based on these guidelines. As an identity code of its scientific method and action, the journal promotes forms of meeting and mediation among theoretical thought, technical and local knowledge. The journal is intended as an observatory on innovation practices and a place of theoretical reflection on them, providing information, conceptual and practical tools for active citizenship and institutions engaged in various forms of attention to care and government of territories as common goods. The aim is to foster experience exchange and knowledge dissemination and, in a wider perspective, to trigger continuing education and empowerment, by encouraging and strengthening ways of learning and self-learning which can be catalysed by readings.

Abstract

From a territorialist point of view earthquakes, and more generally natural risks, are to be understood as long-term structural invariants of the territory. This involves a change of paradigm, a sort of conceptual transition from ex post intervention to a culture of prevention and programmed maintenance that operates at multiple levels and with multiple cultural visions: from the creation of a 'safe society', where security is not only guaranteed by exogenous and institutional actors but by virtuous mechanisms of endogenous organisation, up to the generation of broad vision and long-term perspective scenarios, able to take into account social desiderata and normative visions of development (social creativity, real utopias, etc.), together with the unpredictable inevitability of natural events (in this case earthquakes). For the safe society it is necessary to turn towards a real complementarity between contextual and expert knowledge, whether we speak of social self-defence ability from catastrophic risks, whether of constructive skills, whether finally of activating a scenario building activity, potentially engaging inhabitants and territory in a multigenerational perspective. A perspective clearly identifying a path of neo-centrality of the so-called 'fragile' areas, based on the virtuous (re)use of their patrimonial wealth (environmental, cultural, landscape, agro-forestry, etc.), through institutional architectures and practices of self-government of commons.

Numero speciale: "Dal confinamento pandemico nuove forme dell'abitare"

A cura di Anna Marson e Antonella Tarpino

La pandemia del coronavirus ha stravolto le vite di molte persone, comunità e famiglie. In breve tempo lo spazio possibile del mondo si è ristretto allo spazio obbligato della casa. Riteniamo importante indagare se e come questa esperienza stia generando in modo accelerato un cambiamento della domanda dell'abitare – antropologica, sociale, territoriale (i cui segni si stanno palesando in questo periodo in molti documenti di associazioni, intellettuali, politici) – da mettere a confronto con le prospettive eco-territorialiste di "ritorno al territorio", progettate e praticate sperimentando modelli bioregionalisti di insediamento umano sui quali la Società dei territorialisti lavora da tempo, come testimoniano i primi otto numeri della Rivista.

A questo riguardo sollecitiamo contributi che restituiscano evidenze, non opinioni, citando esempi concreti a sostegno di riflessioni che possano costituire i presupposti per un
